

# :Thermostar P970

## Thermal-sensitive layer

The upper layer is highly sensitive to infrared light, giving extremely fast imaging speeds. During exposure, the thermal laser causes a heat-induced transformation to take place in the top layer. During development, the alkaline developers penetrate only the exposed areas. The result is a sharp definition between exposed and unexposed areas, creating high-resolution plates capable of 1% to 99% at 200 lpi. This makes :Thermostar appropriate for a wide range of high-quality applications - including stochastic and hybrid screening.
